

Executive Summary

Toolkit modules

Module	Purpose
AI System Inventory	Records university AI systems, owners, deployment status, and risk tier
Current Deployment Risk Monitor	Audits live systems such as AI detectors, chatbots, VLE analytics, and career AI
Future Deployment Readiness	Assesses AI-assisted marking, early-alert prediction, automated scoring, and admissions-support tools
Gender AI Proficiency Gap Monitor	Tracks unequal AI access, confidence, usage, and training
Governance Evidence Pack Validator	Checks whether DPIA, equality review, appeals, monitoring, and vendor evidence exist
Risk Scoring Engine	Converts evidence and control maturity into residual risk and deployment recommendation

Demonstration case studies

Case Study 1: AI detection tool stress test

The synthetic AI detection dataset demonstrates how a university could audit an AI plagiarism or AI-writing detector for:

- False positive rate by gender
- False negative rate by gender
- Detection flag rate by gender
- Human review rate by gender
- Appeal success rate by gender
- Misconduct case escalation rate by gender

This is a synthetic stress test only. It does not prove real-world gender harm.

Case Study 2: OULAD VLE analytics audit

The OULAD workflow demonstrates how learning analytics data can be prepared for:

- Representation analysis
- VLE engagement fairness checks
- Proxy-bias detection
- Outcome gap monitoring
- Early-alert risk review

OULAD must be downloaded separately and should not be committed to GitHub as raw third-party data unless licence and

file-size considerations are checked.

Deployment decision outcomes

Recommendation Meaning

Approve Controls are strong and residual risk is low

Approve with monitoring Risk is manageable but requires ongoing review

Pilot only Evidence is incomplete, so the system should not scale yet

Pause deployment Material fairness or governance gaps must be resolved

Reject / prohibit System creates unacceptable risk or lacks essential safeguards
